35. Which of the following volume (V), temperature (T) plots represents the behaviour of one mole of an ideal gas at one atmospheric pressure?

C

**Sol** Find the volume by either

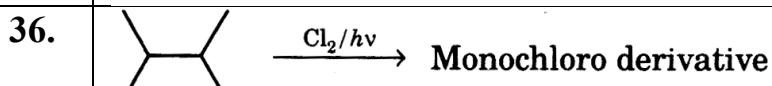

$$V = \frac{RT}{P} \quad (\text{PV} = \text{RT}) \text{ or } P_1 V_1 = P_2 V_2$$

and match it with the values given in graph to find correct.

Volume of 1 mole of an ideal gas at 273 K and 1 atm is 22.4 L and that at 373 K and 1 atm pressure is calculated as

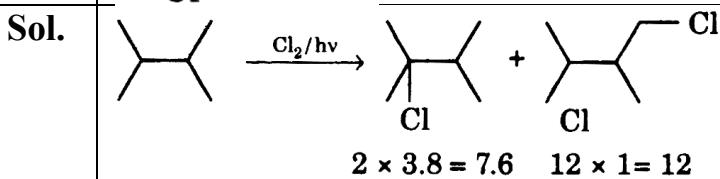

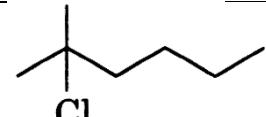

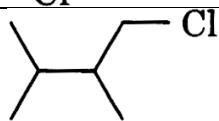

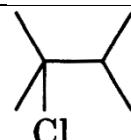

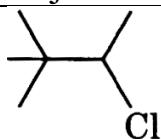

$$V = \frac{RT}{P} = \frac{0.082 \times 373}{1} = 30.58 \text{ L}$$

$$\simeq 30.6 \text{ L}$$

C

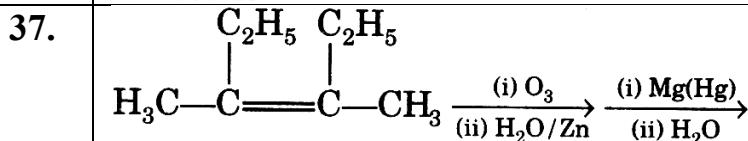

Major monochloro derivative will be :

$$2 \times 3.8 = 7.6 \quad 12 \times 1 = 12$$

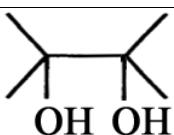

$R_1 : R_2 : R_3$

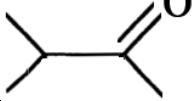

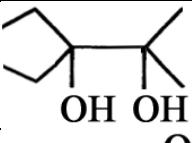

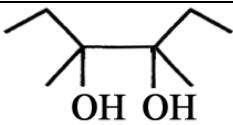

$1 : 3.8 : 45$

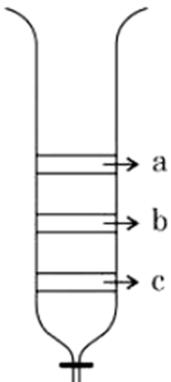

B

Product is :

38. From the figure of column chromatography given below, identify incorrect statements.

- A. Compound 'c' is more polar than 'a' and 'b'.
- B. Compound 'a' is least polar
- C. Compound 'b' comes out of the column before 'c' and after 'a'
- D. Compound 'a' spends more time in the column.

Choose the correct answer from the options given below.

A, B and C only

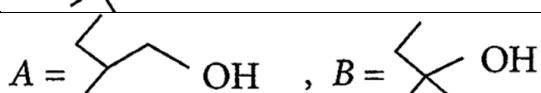

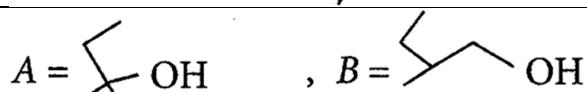

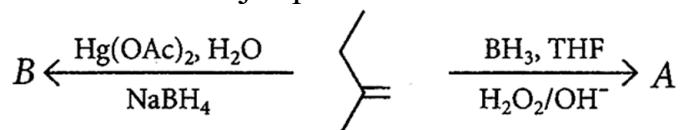

A, B and D only

B, C and D only

B and D only

- Sol.** In column chromatography, mixture is dissolved in minimum volume of a suitable highly polar solvent and applied on the top of column of adsorbent. As solution moves down, mixture is adsorbed. The components are adsorbed on the basis of extent of polarity. The polarity order is  $a > b > c$  then compound a is strongly adsorbed followed by b and then c. Thus, c is least polar among all (a, b, c) components. Compound a is most polar. Compound b will come out after c before a and compound a will spend more time in column. Thus, the incorrect statements are A, B and C.

- 43.** The pair in which phosphorous atom have a formal oxidation state of + 3 is **B**
- Pyrophosphorous and pyrophosphoric acids
  - Orthophosphorous and pyrophosphorous acids
  - Pyrophosphorous and hypophosphoric acids
  - Orthophosphorous and hypophosphoric acids

**Sol.**

Acid Formula Formal oxidation state of phosphorous

Pyrophosphorous acids  $\text{H}_4\text{P}_2\text{O}_5$  +3

Pyrophosphoric acid  $\text{H}_4\text{P}_2\text{O}_7$  +5

Orthophosphorous acid  $\text{H}_3\text{PO}_3$  +3

Hypophosphoric acid  $\text{H}_4\text{P}_2\text{O}_6$  +4

Both pyrophosphorous and orthophosphorous acids have +3 formal oxidation state.

**Sol.**

$$(a) \text{ Given, } f(x+y) = f(x) \cdot f'(y) \\ + f'(x) \cdot f(y)$$

Put  $y=0$ 

$$f(x) = f(x) \cdot f'(0) + f'(x) f(0)$$

$$f(x) = f(x) \cdot f'(0) + f'(x) \quad \dots$$

[ $\because f(0) = 1$ ]

Put  $x = y = 0$ 

$$f(0) = f'(0) + f'(0) \Rightarrow f'(0) = \frac{1}{2}$$

Hence, equation (i) becomes

$$f(x) = \frac{f(x)}{2} + f'(x)$$

$$f'(x) = \frac{f(x)}{2} \Rightarrow \frac{f'(x)}{f(x)} = \frac{1}{2}$$

On integrating both sides, we get

$$\ln f(x) = \frac{x}{2} + C$$

Put  $x = 0 \Rightarrow C = 0$ 

$$\Rightarrow \ln f(x) = \frac{x}{2} \Rightarrow f(x) = e^{\frac{x}{2}}$$

$$\therefore f(n) = e^{\frac{n}{2}}$$

$$\log_e f(n) = \frac{n}{2}$$

$$\begin{aligned} \therefore \sum_{n=1}^{100} \log_e f(n) &= \frac{1}{2} \sum_{n=1}^{100} n \\ &= \frac{1}{2} \sum_{n=1}^{100} n = \frac{1}{2} \left( \frac{100}{2} (100+1) \right) \\ &= 25 \times 101 = 2525 \end{aligned}$$

**64.**

A water tank has the shape of an inverted right circular cone, whose semi-vertical angle is  $\tan^{-1} \left( \frac{1}{2} \right)$ . Water is poured into it at a constant rate of 5 cu m/min. Then, the rate (in m/min) at which the level of water is rising at the instant when the depth of water in the tank is 10 m, is

**B**

$$\frac{2}{\pi}$$

$$\frac{1}{5\pi}$$

$$\frac{1}{15\pi}$$

$$\frac{1}{10\pi}$$

**Sol.**

(b)

Use formula : Volume of cone  
 $= \frac{1}{3} \pi r^2 h$ , where  $r$  = radius  
and  $h$  = height of the cone

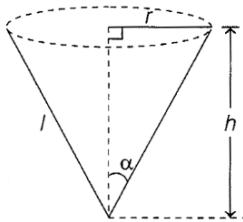

Given, semi-vertical angle of right circular cone  $= \tan^{-1}\left(\frac{1}{2}\right)$

$$\text{Let } \alpha = \tan^{-1}\left(\frac{1}{2}\right)$$

$$\Rightarrow \tan \alpha = 1/2$$

$$\Rightarrow \frac{r}{h} = \frac{1}{2} \quad [\text{from fig. } \tan \alpha = \frac{r}{h}]$$

$$\Rightarrow r = \frac{1}{2}h$$

$$\therefore \text{Volume of cone is } (V) = \frac{1}{3} \pi r^2 h$$

$$\therefore V = \frac{1}{3} \pi \left(\frac{1}{2}h\right)^2 (h) = \frac{1}{12} \pi h^3$$

[from Eq. (i)]

On differentiating both sides w.r.t. 't'. we get

$$\frac{dV}{dt} = \frac{1}{12} \pi (3h^2) \frac{dh}{dt} \Rightarrow \frac{dh}{dt} = \frac{4}{\pi h^2} \frac{dV}{dt}$$

$$\Rightarrow \frac{dh}{dt} = \frac{4}{\pi h^2} \times 5$$

$[\because \text{given } \frac{dV}{dt} = 5 \text{ m}^3/\text{min}]$

Now, at  $h = 10 \text{ m}$ , the rate at which

$$\begin{aligned} \text{height of water level is rising} &= \frac{dh}{dt} \Big|_{h=10} \\ &= \frac{4}{\pi(10)^2} \times 5 = \frac{1}{5\pi} \text{ m/min} \end{aligned}$$

**65.**

Let  $\frac{\pi}{2} < x < \pi$  be such that  $\cot x = \frac{-5}{\sqrt{11}}$ . Then,  $(\sin \frac{11x}{2})(\sin 6x - \cos 6x) + (\cos \frac{11x}{2})(\sin 6x + \cos 6x)$  is equal to

**B**

$$\frac{\sqrt{11}-1}{2\sqrt{3}}$$

$$\frac{\sqrt{11}+1}{2\sqrt{3}}$$

$$\frac{\sqrt{11}+1}{3\sqrt{2}}$$

$$\frac{\sqrt{11}-1}{3\sqrt{2}}$$

**Sol.**

(b)

 **key idea** Let's write  $\sin 6x = \cos\left(\frac{\pi}{2} - 6x\right)$

By using  
 $\cos A + \cos B = 2 \cos \frac{A+B}{2} \cos \frac{A-B}{2}$   
and  $\cos A - \cos B = 2 \sin \frac{A+B}{2} \sin \frac{B-A}{2}$

We know that

$$\frac{\pi}{2} < x < \pi \text{ and } \cot x = \frac{-5}{\sqrt{11}}$$

Now,

$$\begin{aligned} & \sin\left(\frac{11x}{2}\right)(\sin 6x - \cos 6x) \\ & + \cos\left(\frac{11x}{2}\right)(\sin 6x + \cos 6x) \\ \Rightarrow & \sin \frac{11x}{2} \left( \cos\left(\frac{\pi}{2} - 6x\right) - \cos 6x \right) \\ & + \cos \left( \frac{11x}{2} \right) \left( \cos\left(\frac{\pi}{2} - 6x\right) + \cos 6x \right) \\ \Rightarrow & \sin \frac{11x}{2} \left( 2 \sin \frac{\pi}{4} \sin \left( 6x - \frac{\pi}{4} \right) \right) \\ & + \cos \left( \frac{11x}{2} \right) \left( 2 \cos \frac{\pi}{4} \cos \left( 6x - \frac{\pi}{4} \right) \right) \\ \Rightarrow & \sqrt{2} \left[ \sin \frac{11x}{2} \sin \left( 6x - \frac{\pi}{4} \right) \right. \\ & \left. + \cos \frac{11x}{2} \cos \left( 6x - \frac{\pi}{4} \right) \right] \\ \Rightarrow & \sqrt{2} \cos \left( \frac{11x}{2} - 6x + \frac{\pi}{4} \right) \end{aligned}$$

[ $\because \cos(A-B) = \cos A \cos B + \sin A \sin B$ ]

$$\begin{aligned} & \Rightarrow \sqrt{2} \cos \left( \frac{\pi}{4} - \frac{x}{2} \right) \\ & \Rightarrow \sqrt{2} \left( \cos \frac{\pi}{4} \cos \frac{x}{2} + \sin \frac{\pi}{4} \sin \frac{x}{2} \right) \\ & \Rightarrow \cos \frac{x}{2} + \sin \frac{x}{2} \quad \dots(i) \end{aligned}$$

Now, if  $\cot x = \frac{-5}{\sqrt{11}}$ 

$$\begin{aligned} & \Rightarrow \tan x = \frac{-\sqrt{11}}{5} \\ & \Rightarrow \frac{2 \tan \frac{x}{2}}{1 - \tan^2 \frac{x}{2}} = \frac{-\sqrt{11}}{5} \end{aligned}$$

On solving,

$$\tan \frac{x}{2} = \sqrt{11}, -\frac{1}{\sqrt{11}}$$

Since,  $\frac{\pi}{2} < x < \pi \Rightarrow \frac{\pi}{4} < \frac{x}{2} < \frac{\pi}{2}$  $\Rightarrow \tan \frac{x}{2}$  will be positive.

$$\therefore \tan \frac{x}{2} = \sqrt{11}$$

$$\Rightarrow \sin \frac{x}{2} = \frac{\sqrt{11}}{2\sqrt{3}} \text{ and } \cos \frac{x}{2} = \frac{1}{2\sqrt{3}}$$

So, Eq. (i) will becomes,

$$\begin{aligned} & \Rightarrow \cos \frac{x}{2} + \sin \frac{x}{2} = \frac{1}{2\sqrt{3}} + \frac{\sqrt{11}}{2\sqrt{3}} \\ & = \frac{\sqrt{11} + 1}{2\sqrt{3}} \end{aligned}$$
